Matrix Multiplication

Properties of Matrix Multiplication

# Matrix Multiplication

# Matrix Multiplication

#### Definition (Product of two matrices)

Let A be an  $m \times n$  matrix and let  $B = \begin{bmatrix} \vec{b_1} & \vec{b_2} & \cdots & \vec{b_p} \end{bmatrix}$  be an  $n \times p$  matrix, whose columns are  $\vec{b_1}, \vec{b_2}, \dots, \vec{b_p}$ . The product of A and B is the matrix

$$AB = A \begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \cdots & \vec{b}_p \end{bmatrix} = \begin{bmatrix} A\vec{b}_1 & A\vec{b}_2 & \cdots & A\vec{b}_p \end{bmatrix}$$

i.e., the first column of AB is  $A\vec{b}_1$ , the second column of AB is  $A\vec{b}_2$ , etc. Note that AB has size  $m \times p$ .

Find the product AB of matrices

$$\mathbf{A} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} -1 & 1 & 2\\ 0 & -2 & 4\\ 1 & 0 & 0 \end{bmatrix}.$$

Find the product AB of matrices

$$\mathbf{A} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} -1 & 1 & 2\\ 0 & -2 & 4\\ 1 & 0 & 0 \end{bmatrix}.$$

# Solution

AB has columns

$$\begin{aligned} \mathbf{A}\vec{\mathbf{b}}_{1} &= \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} -1\\ 0\\ 1 \end{bmatrix} = \begin{bmatrix} 4\\ -1 \end{bmatrix}, \\ \mathbf{A}\vec{\mathbf{b}}_{2} &= \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} 1\\ -2\\ 0 \end{bmatrix} = \begin{bmatrix} -1\\ 4 \end{bmatrix}, \\ \mathbf{A}\vec{\mathbf{b}}_{3} &= \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} 2\\ 4\\ 0 \end{bmatrix} = \begin{bmatrix} -2\\ 0 \end{bmatrix}. \end{aligned}$$

Find the product AB of matrices

$$\mathbf{A} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} -1 & 1 & 2\\ 0 & -2 & 4\\ 1 & 0 & 0 \end{bmatrix}.$$

## Solution

Thus

AB has columns

$$A\vec{b}_{1} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} -1\\ 0\\ 1 \end{bmatrix} = \begin{bmatrix} 4\\ -1 \end{bmatrix},$$
$$A\vec{b}_{2} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} 1\\ -2\\ 0 \end{bmatrix} = \begin{bmatrix} -1\\ 4 \end{bmatrix},$$
$$A\vec{b}_{3} = \begin{bmatrix} -1 & 0 & 3\\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} 2\\ 4\\ 0 \end{bmatrix} = \begin{bmatrix} -2\\ 0 \end{bmatrix}.$$
$$\vec{b}_{3}, AB = \begin{bmatrix} 4 & -1 & -2\\ -1 & 4 & 0 \end{bmatrix}.$$

### Definition

Let A and B be matrices, and suppose that A is  $m \times n$ .

- ► In order for the product AB to exist, the number of rows in B must be equal to the number of columns in A, implying that B is an n × p matrix for some p.
- ▶ When defined, AB is an  $\mathbf{m} \times \mathbf{p}$  matrix.

If the product is defined, then A and B are said to be **compatible** for (matrix) multiplication.

#### Example

As we saw in the previous problem

$$\begin{bmatrix} -1 & 2 \times 3 & & \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} -1 & 1 & 2 \\ 0 & -2 & 4 \\ 1 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 2 \times 3 & & \\ 4 & -1 & -2 \\ -1 & 4 & 0 \end{bmatrix}$$

#### Example

As we saw in the previous problem

$$\begin{bmatrix} -1 & 2 \times 3 & 3 \\ -1 & 0 & 3 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} -1 & 1 & 2 \\ 0 & -2 & 4 \\ 1 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 4 & -1 & -2 \\ -1 & 4 & 0 \end{bmatrix}$$

Note that the product

$$\begin{bmatrix} -1 & 1 & 2 \\ 0 & -2 & 4 \\ 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} -1 & 0 & 3 \\ 2 & -1 & 1 \end{bmatrix}$$

does not exist.

# Example (Multiplication by the zero matrix)

Compute the product AO for the matrix

$$\mathbf{A} = \left[\begin{array}{cc} 1 & 2\\ 3 & 4 \end{array}\right]$$
 and the 2 × 2 zero matrix given by 
$$\mathbf{O} = \left[\begin{array}{cc} 0 & 0\\ 0 & 0 \end{array}\right]$$

# Example (Multiplication by the zero matrix)

Compute the product AO for the matrix

$$\mathbf{A} = \left[\begin{array}{cc} 1 & 2\\ 3 & 4 \end{array}\right]$$
 and the 2 × 2 zero matrix given by 
$$\mathbf{O} = \left[\begin{array}{cc} 0 & 0\\ 0 & 0 \end{array}\right]$$

$$\left[\begin{array}{rrr}1&2\\3&4\end{array}\right]\left[\begin{array}{rrr}0&0\\0&0\end{array}\right]=\left[\begin{array}{rrr}0&0\\0&0\end{array}\right]$$

# Example (Multiplication by the zero matrix)

Compute the product AO for the matrix

$$\mathbf{A} = \left[\begin{array}{cc} 1 & 2\\ 3 & 4 \end{array}\right]$$
 and the 2 × 2 zero matrix given by 
$$\mathbf{O} = \left[\begin{array}{cc} 0 & 0\\ 0 & 0 \end{array}\right]$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \implies AO = O.$$

#### Definition (The (i, j)-entry of a product)

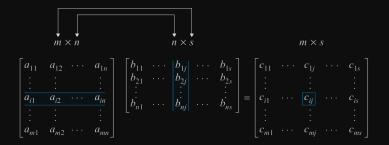

Let  $A = [a_{ij}]$  be an  $m \times n$  matrix and  $B = [b_{ij}]$  be an  $n \times p$  matrix. Then the (i,j)-entry of AB is given by the dot product of row i of A and column j of B:

$$a_{i1}b_{1j}+a_{i2}b_{2j}+\cdots+a_{in}b_{nj}=\sum_{k=1}a_{ik}b_{kj}$$

#### Definition (The (i, j)-entry of a product)

Let  $A = [a_{ij}]$  be an  $m \times n$  matrix and  $B = [b_{ij}]$  be an  $n \times p$  matrix. Then the (i, j)-entry of AB is given by the dot product of row i of A and column j of B:

$$a_{i1}b_{1j}+a_{i2}b_{2j}+\cdots+a_{in}b_{nj}=\sum_{k=1}a_{ik}b_{kj}$$

#### Example

Using the above definition, the (2,3)-entry of the product

$$\left[\begin{array}{rrrr} -1 & 0 & 3 \\ 2 & -1 & 1 \end{array}\right] \left[\begin{array}{rrrr} -1 & 1 & 2 \\ 0 & -2 & 4 \\ 1 & 0 & 0 \end{array}\right]$$

is computed by the dot product of the second row of the first matrix and the third column of the second matrix:

$$2 \times 2 + (-1) \times 4 + 1 \times 0 = 4 - 4 + 0 = 0.$$

Properties of Matrix Multiplication

Properties of Matrix Multiplication

Given matrices A and B, is AB = BA?

Let

$$\mathbf{A} = \begin{bmatrix} 1 & 2\\ -3 & 0\\ 1 & -4 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} 1 & -1 & 2 & 0\\ 3 & -2 & 1 & -3 \end{bmatrix}$$

▶ Does AB exist? If so, compute it.

▶ Does BA exist? If so, compute it.

Let

$$\mathbf{A} = \begin{bmatrix} 1 & 2\\ -3 & 0\\ 1 & -4 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} 1 & -1 & 2 & 0\\ 3 & -2 & 1 & -3 \end{bmatrix}$$

▶ Does AB exist? If so, compute it.

▶ Does BA exist? If so, compute it.

Let

$$\mathbf{A} = \begin{bmatrix} 1 & 2\\ -3 & 0\\ 1 & -4 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} 1 & -1 & 2 & 0\\ 3 & -2 & 1 & -3 \end{bmatrix}$$

▶ Does AB exist? If so, compute it.

▶ Does BA exist? If so, compute it.

$$AB = \begin{bmatrix} 7 & -5 & 4 & -6 \\ -3 & 3 & -6 & 0 \\ -11 & 7 & -2 & 12 \end{bmatrix}$$

Let

$$\mathbf{A} = \begin{bmatrix} 1 & 2\\ -3 & 0\\ 1 & -4 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} 1 & -1 & 2 & 0\\ 3 & -2 & 1 & -3 \end{bmatrix}$$

▶ Does AB exist? If so, compute it.

▶ Does BA exist? If so, compute it.

Solution

$$AB = \begin{bmatrix} 7 & -5 & 4 & -6 \\ -3 & 3 & -6 & 0 \\ -11 & 7 & -2 & 12 \end{bmatrix}$$

BA does not exist!

Let

$$\mathbf{G} = \left[ \begin{array}{c} 1\\1 \end{array} \right] \quad \text{and} \quad \mathbf{H} = \left[ \begin{array}{cc} 1 & 0 \end{array} \right]$$

- ▶ Does GH exist? If so, compute it.
- ▶ Does HG exist? If so, compute it.

Let

$$\mathbf{G} = \left[ \begin{array}{c} 1\\1 \end{array} \right] \quad \text{and} \quad \mathbf{H} = \left[ \begin{array}{cc} 1 & 0 \end{array} \right]$$

▶ Does GH exist? If so, compute it.

▶ Does HG exist? If so, compute it.

Let

$$\mathbf{G} = \left[ \begin{array}{c} 1\\1 \end{array} \right] \quad \text{and} \quad \mathbf{H} = \left[ \begin{array}{cc} 1 & 0 \end{array} \right]$$

▶ Does GH exist? If so, compute it.

▶ Does HG exist? If so, compute it.

$$\mathbf{GH} = \left[ \begin{array}{cc} 1 & 0\\ 1 & 0 \end{array} \right]$$

Let

$$\mathbf{G} = \left[ \begin{array}{c} 1\\1 \end{array} \right] \quad \text{and} \quad \mathbf{H} = \left[ \begin{array}{cc} 1 & 0 \end{array} \right]$$

▶ Does GH exist? If so, compute it.

▶ Does HG exist? If so, compute it.

$$GH = \begin{bmatrix} 1 & 0\\ 1 & 0 \end{bmatrix}$$
$$HG = \begin{bmatrix} 1 \end{bmatrix}$$

Let

$$\mathbf{G} = \left[ \begin{array}{c} 1\\1 \end{array} \right] \quad \text{and} \quad \mathbf{H} = \left[ \begin{array}{cc} 1 & 0 \end{array} \right]$$

▶ Does GH exist? If so, compute it.

▶ Does HG exist? If so, compute it.

#### Solution

$$GH = \begin{bmatrix} 1 & 0\\ 1 & 0 \end{bmatrix}$$
$$HG = \begin{bmatrix} 1 \end{bmatrix}$$

#### Remark

In this example, GH and HG both exist, but they are not equal. They aren't even the same size!

Let

$$\mathbf{P} = \left[ \begin{array}{cc} 1 & 0 \\ 2 & -1 \end{array} \right] \quad \text{and} \quad \mathbf{Q} = \left[ \begin{array}{cc} -1 & 1 \\ 0 & 3 \end{array} \right]$$

▶ Does PQ exist? If so, compute it.

▶ Does QP exist? If so, compute it.

Let

$$\mathbf{P} = \left[ \begin{array}{cc} 1 & 0 \\ 2 & -1 \end{array} \right] \quad \text{and} \quad \mathbf{Q} = \left[ \begin{array}{cc} -1 & 1 \\ 0 & 3 \end{array} \right]$$

▶ Does PQ exist? If so, compute it.

► Does QP exist? If so, compute it.

Let

$$\mathbf{P} = \left[ \begin{array}{cc} 1 & 0 \\ 2 & -1 \end{array} \right] \quad \text{and} \quad \mathbf{Q} = \left[ \begin{array}{cc} -1 & 1 \\ 0 & 3 \end{array} \right]$$

▶ Does PQ exist? If so, compute it.

► Does QP exist? If so, compute it.

$$PQ = \begin{bmatrix} -1 & 1\\ -2 & -1 \end{bmatrix}$$

Let

$$\mathbf{P} = \left[ \begin{array}{cc} 1 & 0 \\ 2 & -1 \end{array} \right] \quad \text{and} \quad \mathbf{Q} = \left[ \begin{array}{cc} -1 & 1 \\ 0 & 3 \end{array} \right]$$

▶ Does PQ exist? If so, compute it.

► Does QP exist? If so, compute it.

$$PQ = \begin{bmatrix} -1 & 1\\ -2 & -1 \end{bmatrix}$$
$$QP = \begin{bmatrix} 1 & -1\\ 6 & -3 \end{bmatrix}$$

Let

$$\mathbf{P} = \left[ \begin{array}{cc} 1 & 0 \\ 2 & -1 \end{array} \right] \quad \text{and} \quad \mathbf{Q} = \left[ \begin{array}{cc} -1 & 1 \\ 0 & 3 \end{array} \right]$$

▶ Does PQ exist? If so, compute it.

► Does QP exist? If so, compute it.

## Solution

$$PQ = \begin{bmatrix} -1 & 1\\ -2 & -1 \end{bmatrix}$$
$$QP = \begin{bmatrix} 1 & -1\\ 6 & -3 \end{bmatrix}$$

#### Remark

In this example, PQ and QP both exist and are the same size, but  $PQ \neq QP$ .

#### Fact

The three preceding problems illustrate an important property of matrix multiplication.

In general, matrix multiplication is **not** commutative, i.e., the order of the matrices in the product is important.

In other words, in general

 $AB \neq BA.$ 

Multiplying from left or right, it MATTERS!

Let

$$\mathbf{U} = \left[ \begin{array}{cc} 2 & 0 \\ 0 & 2 \end{array} \right] \quad \text{and} \quad \mathbf{V} = \left[ \begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array} \right]$$

► Does UV exist? If so, compute it.

▶ Does VU exist? If so, compute it.

Let

$$\mathbf{U} = \left[ \begin{array}{cc} 2 & 0 \\ 0 & 2 \end{array} \right] \quad \text{and} \quad \mathbf{V} = \left[ \begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array} \right]$$

► Does UV exist? If so, compute it.

▶ Does VU exist? If so, compute it.

$$\mathrm{UV} = \left[ \begin{array}{cc} 2 & 4\\ 6 & 8 \end{array} \right]$$

Let

$$\mathbf{U} = \left[ \begin{array}{cc} 2 & 0 \\ 0 & 2 \end{array} \right] \quad \text{and} \quad \mathbf{V} = \left[ \begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array} \right]$$

► Does UV exist? If so, compute it.

▶ Does VU exist? If so, compute it.

$$UV = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$
$$VU = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$

## $\operatorname{Problem}$

Let

$$\mathbf{U} = \left[ \begin{array}{cc} 2 & 0 \\ 0 & 2 \end{array} \right] \quad \text{and} \quad \mathbf{V} = \left[ \begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array} \right]$$

▶ Does UV exist? If so, compute it.

▶ Does VU exist? If so, compute it.

## Solution

$$UV = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$
$$VU = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$

#### Remark

In this particular example, the matrices commute, i.e., UV = VU.

Let A, B, and C be matrices of the appropriate sizes, and let  $r\in\mathbb{R}$  be a scalar. Then the following properties hold.

Let A, B, and C be matrices of the appropriate sizes, and let  $r \in \mathbb{R}$  be a scalar. Then the following properties hold.

- 1. IA = A and AI = A.
- 2. A(B + C) = AB + AC.

(matrix multiplication distributes over matrix addition).

Let A, B, and C be matrices of the appropriate sizes, and let  $r \in \mathbb{R}$  be a scalar. Then the following properties hold.

- 1. IA = A and AI = A.
- 2. A(B+C) = AB + AC.(matrix multiplication distributes over matrix addition)
- 3. (B + C)A = BA + CA.

(matrix multiplication distributes over matrix addition).

Let A, B, and C be matrices of the appropriate sizes, and let  $r \in \mathbb{R}$  be a scalar. Then the following properties hold.

- 1. IA = A and AI = A.
- 2. A(B + C) = AB + AC.(matrix multiplication distributes over matrix addition).
- 3. (B + C)A = BA + CA.

(matrix multiplication distributes over matrix addition).

4. A(BC) = (AB) C. (matrix multiplication is associative).

Let A, B, and C be matrices of the appropriate sizes, and let  $r \in \mathbb{R}$  be a scalar. Then the following properties hold.

- 1. IA = A and AI = A.
- 2. A(B + C) = AB + AC. (matrix multiplication distributes over matrix addition).
- (B + C)A = BA + CA. (matrix multiplication distributes over matrix addition).
- 4. A(BC) = (AB) C. (matrix multiplication is associative).
- 5. r(AB) = (rA)B = A(rB).
- 6.  $(AB)^{T} = B^{T}A^{T}$ .

Let A, B, and C be matrices of the appropriate sizes, and let  $r \in \mathbb{R}$  be a scalar. Then the following properties hold.

- 1. IA = A and AI = A.
- 2. A(B + C) = AB + AC. (matrix multiplication distributes over matrix addition).

3. 
$$(B + C)A = BA + CA.$$
  
(matrix multiplication distributes over matrix addition).

- 4. A(BC) = (AB) C. (matrix multiplication is associative).
- 5. r(AB) = (rA)B = A(rB).
- 6.  $(AB)^{T} = B^{T}A^{T}$ .

## Remark

This applies to matrix-vector multiplication as well, since a vector is a row matrix or a column matrix.

Let  $A = [a_{ij}]$ ,  $B = [b_{ij}]$  and  $C = [c_{ij}]$  be three  $n \times n$  matrices. For  $1 \le i, j \le n$  write down a formula for the (i, j)-entry of each of the following matrices.

1.	AB	4.	C(A+B)
2.	BA	5.	A(BC)
3.	A+C	6.	(AB)C

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

#### Proof.

We are given that AC = CA and BC = CB. Consider (A + B)C.

$$(A + B)C =$$

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

#### Proof.

We are given that AC = CA and BC = CB. Consider (A + B)C.

(A + B)C = AC + BC

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

#### Proof.

We are given that AC = CA and BC = CB. Consider (A + B)C.

$$(A + B)C = AC + BC$$
$$= CA + CB$$

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

#### Proof.

We are given that AC = CA and BC = CB. Consider (A + B)C.

$$A + B)C = AC + BC$$
$$= CA + CB$$
$$= C(A + B)$$

Let A and B be  $m \times n$  matrices, and let C be an  $n \times p$  matrix. Prove that if A and B commute with C, then A + B commutes with C.

#### Proof.

We are given that AC = CA and BC = CB. Consider (A + B)C.

$$(A + B)C = AC + BC$$
$$= CA + CB$$
$$= C(A + B)$$

Since (A + B)C = C(A + B), A + B commutes with C.

Let A, B and C be  $n \times n$  matrices, and suppose that both A and B commute with C, i.e., AC = CA and BC = CB. Show that AB commutes with C.

Let A, B and C be  $n \times n$  matrices, and suppose that both A and B commute with C, i.e., AC = CA and BC = CB. Show that AB commutes with C.

#### Proof.

We must show that (AB)C = C(AB) given that AC = CA and BC = CB.

(AB)C = A(BC) (matrix multiplication is associative)

= A(CB) (B commutes with C)

= (AC)B (matrix multiplication is associative)

= (CA)B (A commutes with C)

= C(AB) (matrix multiplication is associative)

Therefore, AB commutes with C.

# Partitioned matrix and block multiplication

## Observation

We can partition matrix into blocks so that each entry of the partitioned matrix is again a matrix.

## Example

$$A = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ \hline 2 & -1 & 4 & 2 & 1 \\ 3 & 1 & -1 & 7 & 5 \end{bmatrix} = \begin{bmatrix} I_2 & 0_{23} \\ P & Q \end{bmatrix} \text{ and } B = \begin{bmatrix} 4 & -2 \\ 5 & 6 \\ \hline 7 & 3 \\ -1 & 0 \\ 1 & 6 \end{bmatrix} = \begin{bmatrix} X \\ Y \end{bmatrix}$$

# Example

Let A and B be  $m\times n$  and  $n\times k$  matrices, respectively. We can partition then into either column vectors or row vectors:

#### Example

Let A and B be  $m \times n$  and  $n \times k$  matrices, respectively. We can partition then into either column vectors or row vectors: When viewed as partitioned matrices, AB can be equivalently written in one of the following four ways:

$$A_{mn} = \begin{pmatrix} \vec{a}_1, \cdots, \vec{a}_n \end{pmatrix} = \begin{pmatrix} \vec{\alpha}_1^T \\ \vdots \\ \vec{\alpha}_m^T \end{pmatrix} \quad \text{and} \quad B_{nk} = \begin{pmatrix} \vec{b}_1, \cdots, \vec{b}_k \end{pmatrix} = \begin{pmatrix} \vec{\beta}_1^T \\ \vdots \\ \vec{\beta}_n^T \end{pmatrix}$$

1.

$$AB = A\left(\vec{b}_1, \cdots, \vec{b}_k\right) = \left(A\vec{b}_1, \cdots, A\vec{b}_k\right)$$

2.

$$AB = \begin{pmatrix} \vec{\alpha}_1^T \\ \vdots \\ \vec{\alpha}_m^T \end{pmatrix} B = \begin{pmatrix} \vec{\alpha}_1^T B \\ \vdots \\ \vec{\alpha}_m^T B \end{pmatrix}$$

# Example (continued)

$$AB = \left(\vec{a}_1, \cdots, \vec{a}_n\right) \begin{pmatrix} \vec{\beta}_1^T \\ \vdots \\ \vec{\beta}_n^T \end{pmatrix} = \vec{a}_1 \vec{\beta}_1^T + \vec{a}_2 \vec{\beta}_2^T + \cdots \vec{a}_n \vec{\beta}_n^T$$

4

$$AB = \begin{pmatrix} \vec{\alpha}_1^{\mathrm{T}} \\ \vdots \\ \vec{\alpha}_m^{\mathrm{T}} \end{pmatrix} \begin{pmatrix} \vec{b}_1, \cdots, \vec{b}_k \end{pmatrix} = \begin{pmatrix} \vec{\alpha}_1^{\mathrm{T}} b_1 & \vec{\alpha}_1^{\mathrm{T}} b_2 & \cdots & \vec{\alpha}_1^{\mathrm{T}} b_k \\ \vec{\alpha}_2^{\mathrm{T}} b_1 & \vec{\alpha}_2^{\mathrm{T}} b_2 & \cdots & \vec{\alpha}_2^{\mathrm{T}} b_k \\ \vdots & \vdots & \ddots & \vdots \\ \vec{\alpha}_m^{\mathrm{T}} b_1 & \vec{\alpha}_m^{\mathrm{T}} b_m & \cdots & \vec{\alpha}_m^{\mathrm{T}} b_k \end{pmatrix}$$

# Example (continued)

One can also partition A and B as follows:

$$\mathbf{A} = \begin{pmatrix} \mathbf{A}_{11} & \mathbf{A}_{12} \\ \mathbf{A}_{21} & \mathbf{A}_{22} \end{pmatrix} \quad \text{and} \quad \mathbf{B} = \begin{pmatrix} \mathbf{B}_{11} & \mathbf{B}_{12} \\ \mathbf{B}_{21} & \mathbf{B}_{22} \end{pmatrix}$$

in a way that dimensions match. Then

$$AB = \begin{pmatrix} A_{11}B_{11} + A_{12}B_{21} & A_{11}B_{12} + A_{12}B_{22} \\ A_{21}B_{11} + A_{22}B_{21} & A_{21}B_{12} + A_{22}B_{22} \end{pmatrix}$$

Let A be a square matrix. Compute  $A^k$  where  $A = \begin{pmatrix} I & X \\ O & O \end{pmatrix}$ .

# Solution

$$A^2 = \cdots = A.$$

Hence,  $A^k = A$  for all  $k \ge 2$ .
