Remark

Three Types of Elementary Row Operations

- ► Type I: Interchange two rows.
- ► Type II: Multiply a row by a nonzero number.
- ► Type III: Add a (nonzero) multiple of one row to a different row.

Theorem (Multiplication by an Elementary Matrix)

Let A be an $m \times n$ matrix.

If B is obtained from A by performing one single elementary row operation,

then B = EA

where E is the elementary matrix obtained from I_m by performing the same elementary operation on I_m as was performed on A.

Find elementary matrices E and F so that C = FEA.

Solution

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \stackrel{\rightarrow}{\to} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \stackrel{\rightarrow}{\to} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = C$$

Let

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \quad \text{and} \quad C = \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix}$$

Find elementary matrices E and F so that C = FEA.

Solution

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \stackrel{\rightarrow}{\to} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \stackrel{\rightarrow}{\to} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = C$$

where
$$E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

Let

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \quad \text{and} \quad C = \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix}$$

Find elementary matrices E and F so that C = FEA.

Solution

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \xrightarrow{\stackrel{\rightarrow}{E}} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \xrightarrow{\stackrel{\rightarrow}{F}} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = C$$

where
$$E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$
 and $F = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$.

Let

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \quad \text{and} \quad C = \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix}$$

Find elementary matrices E and F so that C = FEA.

Solution

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \xrightarrow{\stackrel{\rightarrow}{E}} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \xrightarrow{\stackrel{\rightarrow}{F}} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = C$$

where
$$E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$
 and $F = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$. Thus we have the sequence $A \to EA \to F(EA) = C$.

Let

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \quad \text{and} \quad C = \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix}$$

Find elementary matrices E and F so that C = FEA.

Solution

Note. The statement of the problem implies that C can be obtained from A by a sequence of two elementary row operations, represented by elementary matrices E and F.

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \xrightarrow{\mathbf{E}} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \xrightarrow{\mathbf{F}} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = \mathbf{C}$$

where $E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ and $F = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$. Thus we have the sequence $A \to EA \to F(EA) = C$, so C = FEA, i.e.,

$$\begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix}$$

Let

$$\mathbf{A} = \left[\begin{array}{cc} 4 & 1 \\ 1 & 3 \end{array} \right] \quad \text{and} \quad \mathbf{C} = \left[\begin{array}{cc} 1 & 3 \\ 2 & -5 \end{array} \right]$$

Find elementary matrices E and F so that C = FEA.

Solution

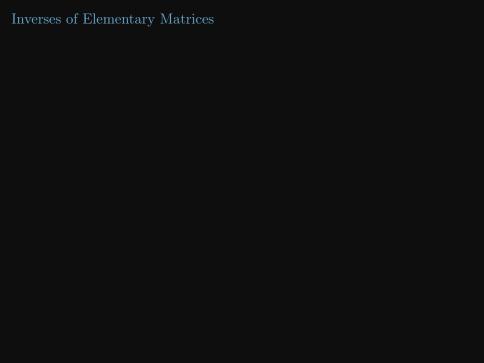

Note. The statement of the problem implies that C can be obtained from A by a sequence of two elementary row operations, represented by elementary matrices E and F.

$$A = \begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix} \xrightarrow{E} \begin{bmatrix} 1 & 3 \\ 4 & 1 \end{bmatrix} \xrightarrow{F} \begin{bmatrix} 1 & 3 \\ 2 & -5 \end{bmatrix} = C$$

where $E = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ and $F = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$. Thus we have the sequence $A \to EA \to F(EA) = C$, so C = FEA, i.e.,

$$\left[\begin{array}{cc} 1 & 3 \\ 2 & -5 \end{array}\right] = \left[\begin{array}{cc} 1 & 0 \\ -2 & 1 \end{array}\right] \left[\begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array}\right] \left[\begin{array}{cc} 4 & 1 \\ 1 & 3 \end{array}\right]$$

You can check your work by doing the matrix multiplication.

Lemma

Every elementary matrix E is invertible, and E^{-1} is also an elementary matrix (of the same type). Moreover, E^{-1} corresponds to the inverse of the row operation that produces E.

Lemma

Every elementary matrix E is invertible, and E^{-1} is also an elementary matrix (of the same type). Moreover, E^{-1} corresponds to the inverse of the row operation that produces E.

The following table gives the inverse of each type of elementary row operation:

Type	Operation	Inverse Operation
I	Interchange rows p and q	Interchange rows p and q
II	Multiply row p by $k \neq 0$	Multiply row p by 1/k
III	Add k times row p to row $q \neq p$	Subtract k times row p from row q

Note that elementary matrices of type I are self-inverse.

Example

Without using the matrix inversion algorithm, find $\overline{\text{the}}$ inverse of the elementary matrix

$$G = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ -3 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Hint. What row operation can be applied to G to transform it to I_4 ? The row operation $G \to I_4$ is to add three times row one to row three,

Suppose A is an $m \times n$ matrix and that B can be obtained from A by a sequence of k elementary row operations.

$$B = E_k(E_{k-1}(\cdots(E_2(E_1A))\cdots))$$

$$B = E_k(E_{k-1}(\cdots(E_2(E_1A))\cdots))$$

Since matrix multiplication is associative, we have

$$B = (E_k E_{k-1} \cdots E_2 E_1) A$$

$$B = E_k(E_{k-1}(\cdots(E_2(E_1A))\cdots))$$

Since matrix multiplication is associative, we have

$$B = (E_k E_{k-1} \cdots E_2 E_1) A$$

or, more concisely, B = UA where $U = E_k E_{k-1} \cdots E_2 E_1$.

$$B = E_k(E_{k-1}(\cdots(E_2(E_1A))\cdots))$$

Since matrix multiplication is associative, we have

$$B = (E_k E_{k-1} \cdots E_2 E_1) A$$

or, more concisely, B = UA where $U = E_k E_{k-1} \cdots E_2 E_1$.

To find U so that B = UA, we could find $E_1, E_2, ..., E_k$ and multiply these together (in the correct order), but there is an easier method for finding U.

Find a matrix U so that R = UA.

Solution

$$\begin{bmatrix} 3 & 0 & 1 & 1 & 0 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & -1 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & -1 \\ 0 & -3 & -2 & -2 & 3 \end{bmatrix}$$
$$\rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & -1 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & 1/3 & 1/3 & 0 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix}$$

Let $A = \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix}$, and let R be the reduced row-echelon form of A.

Find a matrix U so that R = UA.

Solution

$$\begin{bmatrix} 3 & 0 & 1 & 1 & 0 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & -1 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & -1 \\ 0 & -3 & -2 & -2 & 3 \end{bmatrix}$$
$$\rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & -1 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & 1/3 & 1/3 & 0 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix}$$

Starting with $[A \mid I]$, we've obtained $[R \mid U]$.

Let $A = \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix}$, and let R be the reduced row-echelon form of A. Find a matrix U so that R = UA.

Solution

$$\begin{bmatrix} 3 & 0 & 1 & 1 & 0 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & -1 \\ 2 & -1 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & -1 \\ 0 & -3 & -2 & -2 & 3 \end{bmatrix}$$
$$\rightarrow \begin{bmatrix} 1 & 1 & 1 & 1 & -1 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & 1/3 & 1/3 & 0 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{bmatrix}$$

Starting with [A | I], we've obtained [R | U].

Therefore R = UA, where

$$U = \begin{bmatrix} 1/3 & 0 \\ 2/3 & -1 \end{bmatrix}.$$

Let

$$A = \begin{bmatrix} 1 & 2 & -4 \\ -3 & -6 & 13 \\ 0 & -1 & 2 \end{bmatrix}.$$

Suppose we do row operations to put A in reduced row-echelon form, and write down the corresponding elementary matrices.

$$\begin{bmatrix} 1 & 2 & -4 \\ -3 & -6 & 13 \\ 0 & -1 & 2 \end{bmatrix} \xrightarrow{E_1} \begin{bmatrix} 1 & 2 & -4 \\ 0 & 0 & 1 \\ 0 & -1 & 2 \end{bmatrix} \xrightarrow{E_2} \begin{bmatrix} 1 & 2 & -4 \\ 0 & -1 & 2 \\ 0 & 0 & 1 \end{bmatrix} \xrightarrow{E_3} \begin{bmatrix} 1 & 2 & -4 \\ 0 & -1 & 2 \\ 0 & 0 & 1 \end{bmatrix} \xrightarrow{E_3} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}$$

Notice that the reduced row-echelon form of A equals I_3 . Now find the matrices E_1, E_2, E_3, E_4 and E_5 .

$$E_1 = \left[\begin{array}{ccc} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{array} \right],$$

$$\mathbf{E}_1 = \left[\begin{array}{ccc|c} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{array} \right], \mathbf{E}_2 = \left[\begin{array}{ccc|c} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{array} \right]$$

$$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, E_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}, E_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathrm{E}_4 = \left[egin{array}{ccc} 1 & -2 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}

It follows that

$$\begin{array}{rcl} (E_5(E_4(E_3(E_2(E_1A))))) & = & I \\ \\ (E_5E_4E_3E_2E_1)A & = & I \end{array}$$

and therefore

$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$

Since
$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$
,

$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$

$$(A^{-1})^{-1} = (E_5E_4E_3E_2E_1)^{-1}$$

 $A = E_7^{-1}E_9^{-1}E_9^{-1}E_4^{-1}E_7^{-1}$

$$A = E_1^{-1} E_2^{-1} E_3^{-1} E_4^{-1} E_5^{-1}$$

Since
$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$
,

$$\begin{array}{rcl} A^{-1} & = & E_5 E_4 E_3 E_2 E_1 \\ (A^{-1})^{-1} & = & (E_5 E_4 E_3 E_2 E_1)^{-1} \\ A & = & E_1^{-1} E_2^{-1} E_3^{-1} E_4^{-1} E_5^{-1} \end{array}$$

This example illustrates the following result.

Since
$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$
,
$$A^{-1} = E_5 E_4 E_3 E_2 E_1$$
$$(A^{-1})^{-1} = (E_5 E_4 E_3 E_2 E_1)^{-1}$$
$$A = E_1^{-1} E_2^{-1} E_3^{-1} E_4^{-1} E_5^{-1}$$

This example illustrates the following result.

Proof.

1. Apply the elementary row operations:

$$[A|I_{\mathrm{m}}] \stackrel{\mathrm{e.r.o.}}{\longrightarrow} [\mathrm{rref}\,(A)\,|U]$$

2. Apply the elementary column operations:

$$\begin{pmatrix} \operatorname{rref}(A) \\ I_n \end{pmatrix} \overset{\operatorname{e.c.o.}}{\longrightarrow} \begin{pmatrix} \begin{pmatrix} I_r & 0 \\ 0 & 0 \end{pmatrix}_{m \times n} \\ V \end{pmatrix}_{2m \times n}$$

Remark

The elementary column operations above are equivalent to the elementary row operations on the transpose:

$$\begin{bmatrix} \operatorname{rref}(A)^T \middle| I_n \end{bmatrix} \stackrel{\operatorname{e.r.o.}}{\longrightarrow} \begin{bmatrix} \begin{pmatrix} I_r & 0 \\ 0 & 0 \end{pmatrix}_{n \times m} \middle| V^T \end{bmatrix}_{n \times 2m}$$

Find the decomposition of $A = \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix}$ into the Smith normal form:

 $A=\widetilde{U}N\widetilde{V},$ where N is the Smith normal form of A and $\widetilde{U},\widetilde{V}$ are some invertible matrices.

Find the decomposition of $A = \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix}$ into the Smith normal form:

 $A = \widetilde{U}N\widetilde{V}$, where N is the Smith normal form of A and $\widetilde{U},\widetilde{V}$ are some invertible matrices.

Solution

We have seen that

$$[A|I_2] = \left[\begin{array}{cc|cc|c} 3 & 0 & 1 & 1 & 0 \\ 2 & -1 & 0 & 0 & 1 \end{array} \right] \rightarrow \left[\begin{array}{cc|cc|c} 1 & 0 & 1/3 & 1/3 & 0 \\ 0 & 1 & 2/3 & 2/3 & -1 \end{array} \right] = [\mathrm{rref}(A)|U]$$

Now,

$$\left(\operatorname{rref}(A)^{T} \middle| I_{3}\right) = \left[\begin{array}{cc|cc|c} 1 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 \\ \frac{1}{2} & \frac{2}{3} & 0 & 0 & 1 \end{array}\right] \rightarrow \left[\begin{array}{cc|cc|c} 1 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & -\frac{1}{2} & -\frac{2}{3} & 1 \end{array}\right] = \left[N^{T}\middle|V^{T}\right]$$

Solution (Continued)

Hence, we find N = UAV, namely,

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 1/3 & 0 \\ 2/3 & -1 \end{pmatrix} \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix} \begin{pmatrix} 1 & 0 & -1/3 \\ 0 & 1 & -2/3 \\ 0 & 0 & 1 \end{pmatrix}$$

Finally, since U and V are invertible, we see that

$$A = U^{-1}NV^{-1},$$

namely,

$$A = \begin{bmatrix} 3 & 0 & 1 \\ 2 & -1 & 0 \end{bmatrix} = \begin{pmatrix} 1/3 & 0 \\ 2/3 & -1 \end{pmatrix}^{-1} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 & -1/3 \\ 0 & 1 & -2/3 \\ 0 & 0 & 1 \end{pmatrix}$$
$$= \begin{pmatrix} 3 & 0 \\ 2 & -1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 & 1/3 \\ 0 & 1 & 2/3 \\ 0 & 0 & 1 \end{pmatrix}$$
$$= \widetilde{U}N\widetilde{V}.$$
