Carl Friedrich Gauss 
discovered the normal distribution in 1809 as a way to rationalize the **method of least squares**.

(1777-1855)

Marquis de Laplace proved the **central limit theorem**  in 1810, consolidating the importance of the normal distribution in statistics.

(1749-1827)

Notation	$\mathcal{N}(\mu, \sigma^2)$
Parameters	$\mu \in \mathbb{R}$ = mean (location) $\sigma^2 > 0$ = variance (squared scale)
Support	$x \in \mathbb{R}$
PDF	$\frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$
CDF	$\frac{1}{2} \left[1 + \operatorname{erf}\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) \right]$
Quantile	$\mu + \sigma\sqrt{2} \operatorname{erf}^{-1}(2p - 1)$
Mean	μ
Median	μ
Mode	μ
Variance	σ^2
MAD	$\sigma\sqrt{2/\pi}$
Skewness	0
Ex. kurtosis	0
Entropy	$\frac{1}{2} \log(2\pi e\sigma^2)$
MGF	$\exp(\mu t + \sigma^2 t^2 / 2)$
CF	$\exp(i\mu t - \sigma^2 t^2 / 2)$
Fisher information	$\mathcal{I}(\mu, \sigma) = \begin{pmatrix} 1/\sigma^2 & 0 \\ 0 & 2/\sigma^2 \end{pmatrix}$ $\mathcal{I}(\mu, \sigma^2) = \begin{pmatrix} 1/\sigma^2 & 0 \\ 0 & 1/(2\sigma^4) \end{pmatrix}$
Kullback-Leibler divergence	$D_{\text{KL}}(\mathcal{N}_0 \parallel \mathcal{N}_1) = \frac{1}{2} \left\{ \left(\frac{\sigma_0}{\sigma_1} \right)^2 + \frac{(\mu_1 - \mu_0)^2}{\sigma_1^2} - 1 + 2 \ln \frac{\sigma_1}{\sigma_0} \right\}$

Test for normal parameters (one sample test)

Let Y_1, \dots, Y_n be a random sample from $N(\mu, \sigma^2)$.

Prob. 1 Find a test statistic Λ in order to test $H_0 : \mu = \mu_0$ v.s. $H_1 : \mu \neq \mu_0$.

When σ^2 is known: $\Lambda = \frac{\bar{Y} - \mu_0}{\sigma/\sqrt{n}} \sim N(0, 1)$

When σ^2 is unknown: $\Lambda = ?$

Prob. 2 Find a test statistic Λ in order to test $H_0 : \mu = \mu_0$ v.s. $H_1 : \mu > \mu_0$.

⇓

$$\lambda(\mathbf{s}^2) = \left[\frac{\mathbf{s}^2}{\frac{n}{n-1} \sigma_0^2} \right]^{n/2} \exp \left(-\frac{n-1}{2\sigma_0^2} \mathbf{s}^2 + \frac{n}{2} \right) \iff \nu(\mathbf{s}^2) = (\mathbf{s}^2)^{\frac{n}{2}} e^{-\lambda \mathbf{s}^2}$$

By setting $n = 6$ and $\lambda = 0.8$, we see ...

This suggests that the critical region should be of the form in terms of s^2 :

$$(0, c_1) \cup (c_2, \infty)$$

For convenience, we put $\alpha/2$ mass on each tails of S^2 :

Find c_1 and c_2 such that

$$\int_0^{c_1} f_{S^2}(z) dz = \int_{c_2}^{\infty} f_{S^2}(z) dz = \frac{\alpha}{2}.$$

Finally, the test statistic is

$$\boxed{S^2 = \frac{1}{n-1} \sum_{i=1}^n (Y_i - \bar{Y})^2} \quad \text{with} \quad \bar{Y} = \frac{1}{n} \sum_{i=1}^n Y_i$$

Question: Find the exact distribution of S^2 .

Finally, the test statistic is

$$\boxed{S^2 = \frac{1}{n-1} \sum_{i=1}^n (Y_i - \bar{Y})^2} \quad \text{with} \quad \bar{Y} = \frac{1}{n} \sum_{i=1}^n Y_i$$

Statistician William Sealy Gosset, known as "Student" 

Ref. Student's t distribution comes from William Sealy Gosset's 1908 paper in *Biometrika* under the pseudonym "Student".

Gosset worked at the Guinness Brewery in Dublin, Ireland, and was interested in the problems of small samples – for example, the chemical properties of barley where sample sizes might be as few as 3.

- V1 One version of the origin of the pseudonym is that Gosset's employer preferred staff to use pen names when publishing scientific papers instead of their real name, so he used the name "Student" to hide his identity.
- V2 Another version is that Guinness did not want their competitors to know that they were using the t -test to determine the quality of raw material.

Def. **Sampling distributions**

Distributions of functions of random sample of given size.
statistics / estimators

E.g. A random sample of size n from $N(\mu, \sigma^2)$ with σ^2 known.

Sample mean $\bar{Y} = \frac{1}{n} \sum_{i=1}^n Y_i \sim N(\mu, \sigma^2/n)$

Aim: Determine distributions for

Sample variance $S^2 := \frac{1}{n-1} \sum_{i=1}^n (Y_i - \bar{Y})^2$ | *Chi square distr.*

$T := \frac{\bar{Y} - \mu}{S/\sqrt{n}}$ | *Student t distr.*

$\frac{S_1^2}{\sigma_1^2} / \frac{S_2^2}{\sigma_2^2}$ | *F distr.*

E.g. A random sample of size n from $N(\mu, \sigma^2)$ with σ^2 known.

Sample mean $\bar{Y} = \frac{1}{n} \sum_{i=1}^n Y_i \sim N(\mu, \sigma^2/n)$

Aim: Determine distributions for

Sample variance $S^2 := \frac{1}{n-1} \sum_{i=1}^n (Y_i - \bar{Y})^2$ | *Chi square distr.*

$$T := \frac{\bar{Y} - \mu}{S/\sqrt{n}}$$

Student t distr.

$$\frac{S_1^2}{\sigma_1^2} / \frac{S_2^2}{\sigma_2^2}$$

F distr.

Thm 7.3.1. Let $U = \sum_{j=1}^m Z_j^2$, where Z_j are independent $N(0, 1)$ normal r.v.s. Then

$$U \sim \text{Gamma}(\text{shape}=m/2, \text{rate}=1/2).$$

namely,

$$f_U(u) = \frac{1}{2^{m/2}\Gamma(m/2)} u^{\frac{m}{2}-1} e^{-u/2}, \quad u \geq 0.$$

Def 7.3.1. U in Thm 7.3.1 is called **chi square distribution** with m dgs of freedom.

Def 7.3.1. U in Thm 7.3.1 is called **chi square distribution** with m dgs of freedom.

Proof. We first consider the case when $m = 1$. In this case,

$$\begin{aligned}F_{Z^2}(u) &= \mathbb{P}(Z^2 \leq u) \\&= \mathbb{P}(-\sqrt{u} \leq Z \leq \sqrt{u}) \\&= 2\mathbb{P}(0 \leq Z \leq \sqrt{u}) \\&= \frac{2}{\sqrt{2\pi}} \int_0^{\sqrt{u}} e^{-z^2/2} dz\end{aligned}$$

Differentiating both sides of the above eq. in order to obtain the pdf:

$$\begin{aligned}f_{Z^2}(u) &= \frac{d}{du} F_{Z^2}(u) \\&= \frac{2}{\sqrt{2\pi}} \frac{1}{2\sqrt{u}} e^{-u/2} \\&= \frac{1}{\sqrt{2}\Gamma(1/2)} u^{(1/2)-1} e^{-u/2},\end{aligned}$$

which is the pdf of a gamma distribution with $r = \lambda = 1/2$.

Then adding m independent copies of gamma distributions gives another gamma distribution with $r = m/2$ and $\lambda = 1/2$ (See Theorem 4.6.4). \square

Thm 7.3.2. Let Y_1, \dots, Y_n be a random sample from $N(\mu, \sigma^2)$. Then

(a) S^2 and \bar{Y} are independent.

(b) $\frac{(n-1)S^2}{\sigma^2} = \frac{1}{\sigma^2} \sum_{i=1}^n (Y_i - \bar{Y})^2 \sim \text{Chi Square}(n-1)$.

Proof. We will prove the case $n = 2$.

$$\bar{Y} = \frac{Y_1 + Y_2}{2}, \quad Y_1 - \bar{Y} = \frac{Y_1 - Y_2}{2}, \quad Y_2 - \bar{Y} = \frac{Y_2 - Y_1}{2}$$

Then $Y = aX + b$ follows a distribution with pdf:

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right).$$

Proof. Let us first find the pdf for $W := V/U$. By Theorem 7.3.1,

$$f_V(v) = \frac{1}{2^{m/2}\Gamma(m/2)} v^{(m/2)-1} e^{-v/2},$$

$$f_U(u) = \frac{1}{2^{n/2}\Gamma(n/2)} u^{(n/2)-1} e^{-u/2}.$$

Then by Theorem 3.8.4, we see that the pdf of W is

Computing s from data

Step 1 $a = \sum_{i=1}^n y_i$

Step 2. $b = \sum_{i=1}^n y_i^2$

Step 3. $s = \sqrt{\frac{nb - a^2}{n(n-1)}}$

Proof.

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (y_i - \bar{y})^2 = \frac{n(\sum_{i=1}^n y_i^2) - (\sum_{i=1}^n y_i)^2}{n(n-1)}$$

Case Study 7.5.2

Mutual funds are investment vehicles consisting of a portfolio of various types of investments. If such an investment is to meet annual spending needs, the owner of shares in the fund is interested in the average of the annual returns of the fund. Investors are also concerned with the volatility of the annual returns, measured by the variance or standard deviation. One common method of evaluating a mutual fund is to compare it to a benchmark, the Lipper Average being one of these. This index number is the average of returns from a universe of mutual funds.

The Global Rock Fund is a typical mutual fund, with heavy investments in international funds. It claimed to best the Lipper Average in terms of volatility over the period from 1989 through 2007. Its returns are given in the table below.

Year	Investment Return %	Year	Investment Return %
1989	15.32	1999	27.43
1990	1.62	2000	8.57
1991	28.43	2001	1.88

The standard deviation for these returns is 11.28%, while the corresponding figure for the Lipper Average is 11.67%. Now, clearly, the Global Rock Fund has a smaller standard deviation than the Lipper Average, but is this small difference due just to random variation? The hypothesis test is meant to answer such questions.

$$H_0 : \sigma^2 = (11.67)^2$$

versus

$$H_1 : \sigma^2 < (11.67)^2$$

Let $\alpha = 0.05$. With $n = 19$, the critical value for the chi square ratio [from part (b) of Theorem 7.5.2] is $\chi_{1-\alpha, n-1}^2 = \chi_{0.95, 18}^2 = 9.390$ (see Figure 7.5.3). But

$$\chi^2 = \frac{(n-1)s^2}{\sigma_0^2} = \frac{(19-1)(11.28)^2}{(11.67)^2} = 16.82$$

so our decision is clear: Do not reject H_0 .
